My spirits are quite low, I don't seem to have achieved any targets for the month and I seem to be slacking. In more positive news, I have started walking again, given up smoking and I have started my fitness regime again. I have not tested the program and I have not tested the code. Disclaimer: I have worked on and tested MS Studio (Eclipse, XMLSpy), and this does not mean that DisAsm is a better solution. Disclaimer: I have watched videos of DisAsm and I have given the author feedback on the website. I have not given DisAsm any of my own experience. Disclaimer: DisAsm is here just to help you when creating your own programs for compilation, not to cover all of the legalities of reverse engineering. Disclaimer: The next three paragraphs are so I can say that I have a lot of experience with disassembling programs and working with them. DisAsm with XMLSpy SourceForge DisAsm with Eclipse SourceForge DisAsm with XMLSpy SourceForge is an alternative to Visual Studio. While it is an IDE as Visual Studio, DisAsm is compatible with Visual Studio on Windows 7. Unlike Eclipse, DisAsm is a console-based application and it is not interactive like XMLSpy. DisAsm with Eclipse SourceForge is an Eclipse plugin for MS Visual Studio. This implies that you can edit and build codes through this tool. However, unlike DisAsm, it is a visual program. To perform repairs and refactoring operations on the code you have to use the GUI interface of XMLSpy and that is a big difference. You can use it at your own risk but if you ever need to see the source code of a program, you will need a way to do it. This tool is different. DisAsm is as interactive as you expect. You don't have to do anything, the tool does all the work for you. However, we recommend only to use it for debugging programs with the info flag set to ON.
