
Thinkpad Fan Controller (tpfancontrol) For Windows

[Download](#)

Thinkpad Fan Controller is an open-source utility designed to help users of notebooks from the Thinkpad T4x (T40/T41/T42/T43) series, which lack appropriate fan control mechanisms. It enables users to manage fan speed in various ways in order to reduce noise levels. Once launched, the program should display the current status of your notebook in regards to system temperature and fan speed. It monitors multiple sensors, showing the temperature of your CPU, GPU, motherboard and more. You can choose from three operating modes: BIOS, Smart and manual. When using the manual mode, you can select one of the seven speed settings at any time. It is also possible to select the preferred option directly from the application's system tray menu. The latest command is displayed in the main window, and a complete log of temperature and fan speed data is also listed. It enables you to keep track of your system's status and ensure temperatures do not exceed safe levels. ***** ThinkPad Fan Controller is an open-source utility designed to help users of notebooks from the Thinkpad T4x (T40/T41/T42/T43) series, which lack appropriate fan control mechanisms. It enables users to manage fan speed in various ways in order to reduce noise levels. Once launched, the program should display the current status of your notebook in regards to system temperature and fan speed. It monitors multiple sensors, showing the temperature of your CPU, GPU, motherboard and more. You can choose from three operating modes: BIOS, Smart and manual. When using the manual mode, you can select one of the seven speed settings at any time. It is also possible to select the preferred option directly from the application's system tray menu. The latest command is displayed in the main window, and a complete log of temperature and fan speed data is also listed. It enables you to keep track of your system's status and ensure temperatures do not exceed safe levels. Features: - Increase/decrease fan speed. - Monitor CPU, GPU, motherboard. - Available on many computer products since 2000. - Average temperature, CPU max, CPU min, GPU max, GPU min, motherboard max, motherboard min. - Log of all speeds or cooled temperatures in no particular order. - Individual temperature for each sensor in each mode. - BIOS-fan controller system (supported by the BIOS of most of these notebooks). - Backward compatibility with the previous ThinkFan command (see below). - Information on ThinkPad, IBM and TPM, and ThinkPad overheating features. - Bilingual: Spanish and English. - Mac and Linux support (tested with X11). - Archive for easy up- and down-load via GitHub or Bitbucket. - An archive of older versions is available at the website. For all the details and the latest official release, visit us at [WINDOWS VERSION](#)

TPFanControl_v0.2.0.exe DESCRIPTION: ***** ThinkPad Fan Controller is an open-source utility designed to help users of notebooks from the Thinkpad T4x (T40/T41/T42/T43) series, which lack appropriate fan control mechanisms. It enables users to manage fan speed in various ways in order to reduce noise levels. Once launched, the program

Thinkpad Fan Controller is designed to reduce system noise on Thinkpad laptops which have no working on-off fan controller. It monitors the temperature of the CPU, GPU, motherboard, hard drives and memory, as well as the rotational speed of the fans. It enables you to set the desired operating temperatures, allowing you to accurately control the temperature within your notebook. Show more... What's new in this version: - Use of Thinkfan v0.8 (new modules); thanks to the users for the feedback. - Do not show errors on startup - in some configurations tpfancontrol will not work properly if it is running as a system daemon. To solve this, you can disable tpfancontrol with the --nodisplay option. - Fix for the window open while on booting in tpfancontrol. - Fix to handle at system start with tpfancontrol. - More support for the hotkey of system settings. - Added support for multiple instances of the application. - Fixes to the crash/freeze/error on startup. - Added support for several Thinkpads T series. Requirements: tpfancontrol is not compatible with Windows 10. It was tested on a Windows 8.1 platform only. Demo Screenshot Screenshot The primary

executable and libraries are located in the [/bin] folder. Quote: The primary executable is tpfancontrol.exe. The actual modules are located in the [/lib/modules] folder, and are dynamically loaded by the executable at runtime. The libraries are statically linked to the executable itself. tpfancontrold.exe is the system daemon, which allows for start/stop functionality. tpfancontrold.exe is preconfigured for usage under Windows 8.1, but can be modified for other versions. Is it possible to change the amount of cores used (from 2 to 4 for example) in any of your modules? I mean, like if i want to use only 4 cores of the CPU instead of 2 but have a module to control for example 2 fans. Is it possible to change the amount of cores used (from 2 to 4 for example) in any of your modules? I mean, like if i want to use only 4 cores of the CPU instead of 2 but

OS: Windows XP/Vista/7/8/10. Processor: Intel Pentium 4 2.4GHz or higher. Memory: 512 MB RAM Graphics: 32MB of video RAM. Sound: Sound Card compatible with DirectX 9 Network: Internet connection Hard Disk: 10GB of free disk space System Requirements: Processor: Intel Pentium 4 2.4GHz or higher
